$\qquad$

N1II
Polynomials $\qquad$

- $f(x)=a_{n} x^{n}+a_{n-1} x^{n-1}+\ldots+a_{1} x+a_{0}$ $\qquad$
- n is the degree of the polynomial
- Examples:
$\qquad$
$f(x)=2 x^{2}-4 x+10 \quad$ degree 2 $\qquad$
$f(x)=6$ degree 0
$\qquad$
$\qquad$
$\qquad$

N1II

## Polynomials in Matlab

- Represented by a row vector in which the $\qquad$ elements are the coefficients.
- Must include all coefficients, even if 0 $\qquad$
- Examples $\qquad$
$8 x+5 \quad p=[85]$
$6 x^{2}-150 \quad h=\left[\begin{array}{lll}6 & 0 & -150\end{array}\right]$ $\qquad$
$\qquad$
$\qquad$

## NHII <br> Value of a Polynomial

- Recall that we can compute the value of a $\qquad$ polynomial for any value of $x$ directly.
- Ex: $f(x)=5 x^{3}+6 x^{2}-7 x+3$ $\qquad$
$x=2$;
$y=\left(5^{*} x^{\wedge} 3\right)+\left(6^{*} x^{\wedge} 2\right)-\left(7^{*} x\right)+3$
$y=$
53 $\qquad$
$\qquad$

NHII

## Value of a

Polynomial

- Matlab can also compute the value of a $\qquad$ polynomial at point $x$ using a function, which is sometimes more convenient $\qquad$
- polyval ( $\mathrm{p}, \mathrm{x}$ )
$-p$ is a vector with the coefficients of the
$\qquad$ polynomial
$-x$ is a number, variable or expression $\qquad$
$\qquad$
$\qquad$

N 11 I

## Value of a <br> polynomial

- Ex: $f(x)=5 x^{3}+6 x^{2}-7 x+3$ $\qquad$
$\mathrm{p}=\left[\begin{array}{lll}5 & 6 & -7\end{array}\right]$; $\qquad$
x = 2;
$y=\operatorname{polyval}(p, x)$
$y=$
53
$\qquad$
$\qquad$
$\qquad$
- Recall that the roots of a polynomial are $\qquad$ the values of the argument for which the polynomial is equal to zero
- Ex: $f(x)=x^{2}-2 x-3$
$0=x^{2}-2 x-3$
$0=(x+1)(x-3)$
$0=x+1 \quad$ OR $\quad 0=x-3$
$x=-1 \quad x=3$ $\qquad$
$\qquad$

## NHII

## Roots of a

 Polynomial- Matlab can compute the roots of a function $\qquad$
- $r=\operatorname{roots}(p)$
$-p$ is a row vector with the coefficients of the
$\qquad$ polynomial
$-r$ is a column vector with the roots of the polynomial
$\qquad$
$\qquad$
$\qquad$
$\qquad$

```
NHII
```

Roots of a Polynomial

- $E x: f(x)=x^{2}-2 x-3$
$p=\left[\begin{array}{ll}1 & -2 \\ -3\end{array}\right] ;$
$r=\operatorname{roots}(p)$
$r=$
3.0000 $\qquad$
-1.0000

## Polynomial Coefficients

- Given the roots of a polynomial, the $\qquad$ polynomial itself can be calculated
- Ex: roots $=-3,+2$
$x=-3 \quad$ OR $x=2$
$0=x+3 \quad 0=x-2$
$0=(x+3)(x-2)$ $\qquad$
$f(x)=x^{2}+x-6$
$\qquad$
$\qquad$

NHII
Polynomial $\qquad$ Coefficients

- Given the roots of a polynomial, Matlab $\qquad$ can compute the coefficients
- $p=p o l y(r)$
$-r$ is a row or column vector with the roots of the polynomial
$\qquad$
$-p$ is a row vector with the coefficients
$\qquad$
$\qquad$
$\qquad$
- Ex: roots = -3, +2 $\qquad$
$r=[-3+2] ;$
$p=\operatorname{poly}(r)$
$p=$
$1 \quad 1 \quad-6$ $\qquad$
$\% f(x)=x^{2}+x-6$
$\qquad$
$\qquad$

## NuI Adding and Subtracting Polynomials

- Polynomials can be added or subtracted
$\qquad$
- Ex: $\mathrm{f} 1(\mathrm{x})+\mathrm{f} 2(\mathrm{x})$
$f 1(x)=3 x^{6}+15 x^{5}-10 x^{3}-3 x^{2}+15 x-40$
$\mathrm{f} 2(\mathrm{x})=\frac{3 \mathrm{x}^{3}-2 \mathrm{x}-6}{3 \mathrm{x}^{6}+15 \mathrm{x}^{5}-7 \mathrm{x}^{3}-3 \mathrm{x}^{2}+13 x-46}$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## N上I Adding and Subtracting Polynomials

- Can do this in Matlab by just adding or subtracting the coefficient vectors
- Both vectors must be of the same size, so the shorter vector must be padded with zeros

```
    Nix Adding and Subtracting
            Polynomials
Ex:
f1(x)=3x
f2(x) = 3x 3}-2x-
p1 = [3 15 0-10-3 15-40];
p2 = [000 0 3 0-2 -6];
p = p1+p2
p=
    3
%f(x)=3x6+15x5-7x - 3x + +13x-46
```

## N1II Multiplying Polynomials

$\qquad$

- Polynomials can be multiplied:
- Ex: $\left(2 x^{2}+x-3\right)^{*}(x+1)=$

$$
\begin{gathered}
2 x^{3}+x^{2}-3 x \\
+\quad 2 x^{2}+x-3 \\
\hline 2 x^{3}+3 x^{2}-2 x-3
\end{gathered}
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## NII Multiplying Polynomials

$\qquad$

- Matlab can also multiply polynomials
- c = $\operatorname{conv}(a, b)$
- $a$ and $b$ are the vectors of the coefficients of the functions being multiplied
$-c$ is the vector of the coefficients of the product
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

N1I Multiplying Polynomials $\qquad$

- Ex: $\left(2 x^{2}+x-3\right) *(x+1)$ $\qquad$
a = [2 1 -3];
b = [lll 11 ;
$\mathrm{c}=\operatorname{conv}(\mathrm{a}, \mathrm{b})$
$\mathrm{C}=$
$\begin{array}{llll}2 & 3 & -2 & -3\end{array}$
$\% 2 x^{3}+3 x^{2}-2 x-3$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## NII Dividing Polynomials

$\qquad$

- Matlab can also divide polynomials $\qquad$
- $[q, 1]=\operatorname{deconv}(u, v)$
$-u$ is the coefficient vector of the numerator
$\qquad$
$-v$ is the coefficient vector of the denominator
$-q$ is the coefficient vector of the quotient
$\qquad$
$-r$ is the coefficient vector of the remainder $\qquad$
$\qquad$
$\qquad$

N1I Dividing Polynomials $\qquad$

- Ex: $\left(x^{2}-9 x-10\right) \div(x+1)$ $\qquad$
$u=[1-9-10] ;$
$\mathrm{v}=\left[\begin{array}{ll}1 & 1\end{array}\right]$;
$[\mathrm{q}, \mathrm{r}]=\operatorname{deconv}(\mathrm{u}, \mathrm{v})$
$q=$
$1-10$ \% quotient is ( $\mathrm{x}-10$ )
$r=$
$0 \quad 0 \quad 0 \%$ remainder is 0
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Example 1

- Write a program to calculate when an object thrown straight up will hit the ground. The equation is $\mathrm{s}(\mathrm{t})=-1 / 2 \mathrm{gt}{ }^{2}+\mathrm{v}_{0} \mathrm{t}+\mathrm{h}_{0}$ $s$ is the position at time $t$ (a position of zero means that the object has hit the ground)
$g$ is the acceleration of gravity: $9.8 \mathrm{~m} / \mathrm{s}^{2}$
$\mathrm{v}_{0}$ is the initial velocity in $\mathrm{m} / \mathrm{s}$
$h_{0}$ is the initial height in meters (ground level is 0 ,
$\qquad$
$\qquad$ thrown from a raised platform

## NIII

## Example 1

$\qquad$
Prompt for and read in initial velocity
$\qquad$ Prompt for and read in initial height Find the roots of the equation
$\qquad$ Solution is the positive root $\qquad$ Display solution
$\qquad$
$\qquad$
$\qquad$

N 11 IT

## Example 1

$\qquad$
$\mathrm{v}=$ input('Please enter initial velocity: '); $\qquad$
$\mathrm{h}=\operatorname{input}($ 'Please enter initial height: ');
$\qquad$
$x=[-4.9 \mathrm{~h}]$;
$y=\operatorname{roots}(x)$;
if $y(1)>=0$
fprintf('The object will hit the ground in \%.2f seconds $\backslash n$ ', $\qquad$ $y(1))$
else
fprintf('The object will hit the ground in \%.2f seconds $\backslash n$ ',
$\qquad$ $\mathrm{y}(2))$ $\qquad$
$\qquad$

Please enter initial velocity: 19.6 $\qquad$
Please enter initial height: 58.8
The object will hit the ground in 6.00 seconds
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## NIII

## Derivatives of Polynomials

- We can take the derivative of polynomials
$f(x)=3 x^{2}-2 x+4$ $\qquad$
$d y=6 x-2$
$d x$ $\qquad$
$\qquad$
$\qquad$

## NHI <br> Derivatives of Polynomials

- Matlab can also calculate the derivatives of polynomials $\qquad$
- $\mathrm{k}=\operatorname{polyder}(\mathrm{p})$
$p$ is the coefficient vector of the polynomial
$\qquad$ k is the coefficient vector of the derivative

$\qquad$
$\qquad$
$\mathrm{p}=[3-24]$;
$\qquad$
$\mathrm{k}=\operatorname{polyder}(\mathrm{p})$
$\mathrm{k}=$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

N1II Integrals of Polynomials $\qquad$

- ? $6 x^{2} d x=6 ? x^{2} d x$ $\qquad$

$$
=6{ }^{*} ? x^{3}
$$

$$
=2 x^{3}
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$

N1I

## Integrals of <br> Polynomials

- Matlab can also calculate the integral of a $\qquad$ polynomial
$\mathrm{g}=\operatorname{polyint}(\mathrm{h}, \mathrm{k})$
$h$ is the coefficient vector of the polynomial
$\qquad$ $g$ is the coefficient vector of the integral $k$ is the constant of integration - assumed $\qquad$ to be 0 if not present
$\qquad$
$\qquad$

| N川II | Integration of Polynomials |
| :---: | :---: |
| $\begin{aligned} & \text { ? } 6 x^{2} d x \\ & \mathrm{~h}=\left[\begin{array}{lll} 6 & 0 & 0 \end{array}\right] \\ & \mathrm{g}=\mathrm{polyint}(\mathrm{~h}) \\ & \mathrm{g}= \\ & 2 \quad 0 \quad 0 \\ & \% \mathrm{~g}(\mathrm{x})=2 \mathrm{x}^{3} \end{aligned}$ | $0$ |

$\qquad$
$\qquad$
$\qquad$
h = [6000; $\qquad$
= $\qquad$
$\qquad$
$\qquad$

## N上I Polynomial Curve Fitting

$\qquad$

Curve fitting is fitting a function to a set of data points $\qquad$

- That function can then be used for various mathematical analyses
- Curve fitting can be tricky, as there are many possible functions and coefficients

N11I

## Curve Fitting

$\qquad$

- Polynomial curve fitting uses the method $\qquad$ of least squares
- Determine the difference between each data $\qquad$ point and the point on the curve being fitted, called the residual
- Minimize the sum of the squares of all of the residuals to determine the best fit $\qquad$
$\qquad$
$\qquad$

Curve Fitting

- A best-fit curve may not pass through any actual data points
- A high-order polynomial may pass through all the points, but the line may deviate from the trend of the data

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

N1II $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## N LII <br> Matlab Curve Fitting

- Matlab provides an excellent polynomial curve fitting interface
- First, plot the data that you want to fit $t=\left[\begin{array}{lll}0.0 & 0.5 & 1.0 \\ 1.5 & 2.0 & 2.53 .03 .54 .04 .5 \text { 5.0]; }\end{array}\right.$ $\mathrm{w}=\left[\begin{array}{lll}6.00 & 4.83 & 3.703 .152 .41 \\ 1.83 & 1.491 .210 .960 .73\end{array}\right.$ 0.64];
plot(t, w)
$\qquad$

Choose Tools/Basic Fitting from the menu on the top of the plot $\qquad$
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## NHII <br> Matlab Curve Fitting

- Choose a fit
- it will be displayed on the plot
- the numerical results will show the equation and the coefficients
- the norm of residuals is a measure of the quality of the fit. A smaller residual is a better fit.
- Repeat until you find the curve with the best fit

## Example 2

$\qquad$

- Find the parabola that best fits the data $\qquad$ points $(-1,10)(0,6)(1,2)(2,1)(3,0)$ $(4,2)(5,4)$ and $(6,7)$
$\qquad$
- The equation for a parabola is $\qquad$
$f(x)=a x^{2}+b x+a$
$\qquad$
$\qquad$
$\qquad$
$Y=[10,6,2,1,0,2,4,7] ;$
plot (X, Y)
$\qquad$

## NHII

$\qquad$

$\qquad$
$\qquad$
$\qquad$ $\square$ $\qquad$

$\qquad$

- All previous examples use polynomial $\qquad$ curves. However, the best fit curve may also be power, exponential, logarithmic or $\qquad$ reciprocal
- See your textbook for information on fitting data to these types of curves

## NHII

## Interpolation

$\qquad$

- Interpolation is estimating values between $\qquad$ data points
- Simplest way is to assume a line between
$\qquad$ each pair of points
- Can also assume a quadratic or cubic polynomial curve connects each pair of points
$\qquad$
$\qquad$

N以I

## Interpolation

$\qquad$

- yi = interp1 ( $x, y$ y xi , 'method') $\qquad$
interp1-last character is one
x is vector with x points
$\qquad$ y is a vector with y points $\qquad$
$x i$ is the $x$ coordinate of the point to be interpolated $\qquad$
yi is the $y$ coordinate of the point being interpolated

| NIII |
| :--- |
| - method is optional: |
| 'nearest' - returns $y$ value of the data point that |
| is nearest to the interpolated x point |
| 'linear' - assume linear curve between each two |
| points (default) |
| 'spline' - assumes a cubic curve between each |
| two points |

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## N LII

## Interpolation

$\qquad$

- Example: $\qquad$
x = [0 12234 5];
$y=[1.0-0.6-1.43 .2-0.7-6.4] ;$ $\qquad$
yi = interp1 ( $x, y, 1.5$, 'linear')
yi $=$ $\qquad$
$-1$
$y j=\operatorname{interp1}(x, y, 1.5$, 'spline')
yj $=$
$-1.7817$ $\qquad$
$\qquad$
